

A Simple Example
of How System Dynamics Modeling
Can Clarify and Improve
Discussion and Modification
of Model Structure

Richard G. Dudley and Chris S. Soderquist

System Dynamics Modeling:

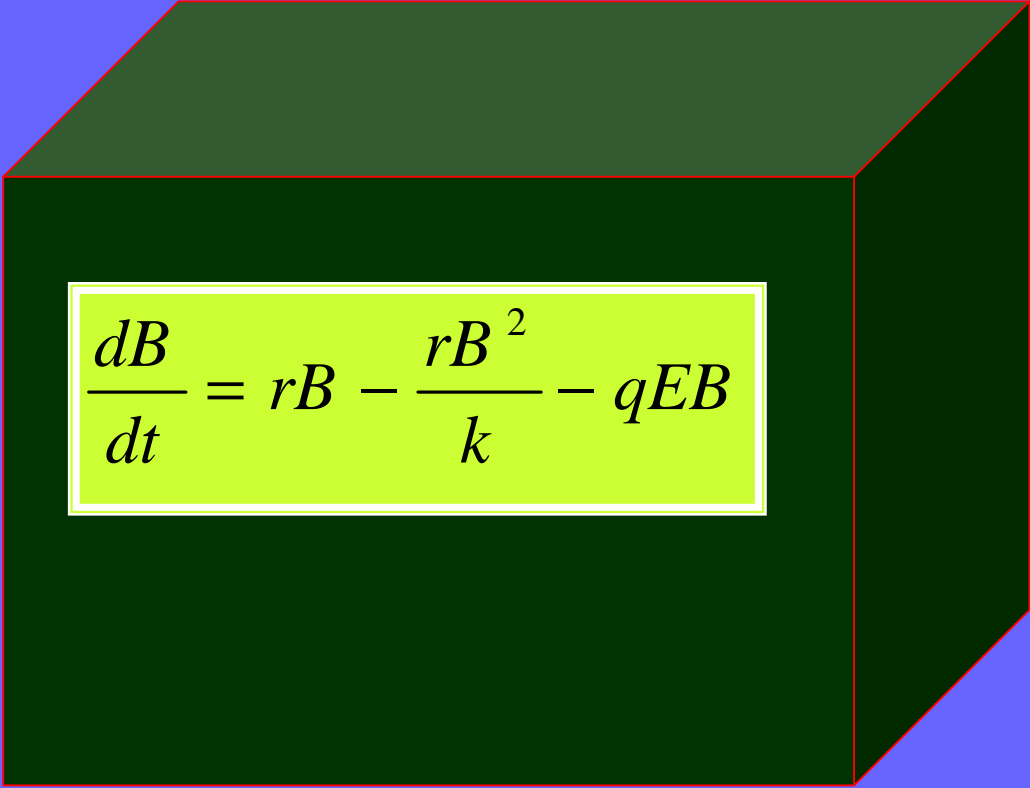

- Uses stock and flow modeling.
- Emphasizes feedback loops.
- Most useful for studying system behavior over time.
- Calculates numerical, rather than analytical, solutions to the system of equations developed.
- Allows complex systems to be modeled

This Is Our Model:

Any comments or suggestions?

This Is Our Model:

$$\frac{dB}{dt} = rB - \frac{rB^2}{k} - qEB$$

Any comments or suggestions?

This is the basis of our model:

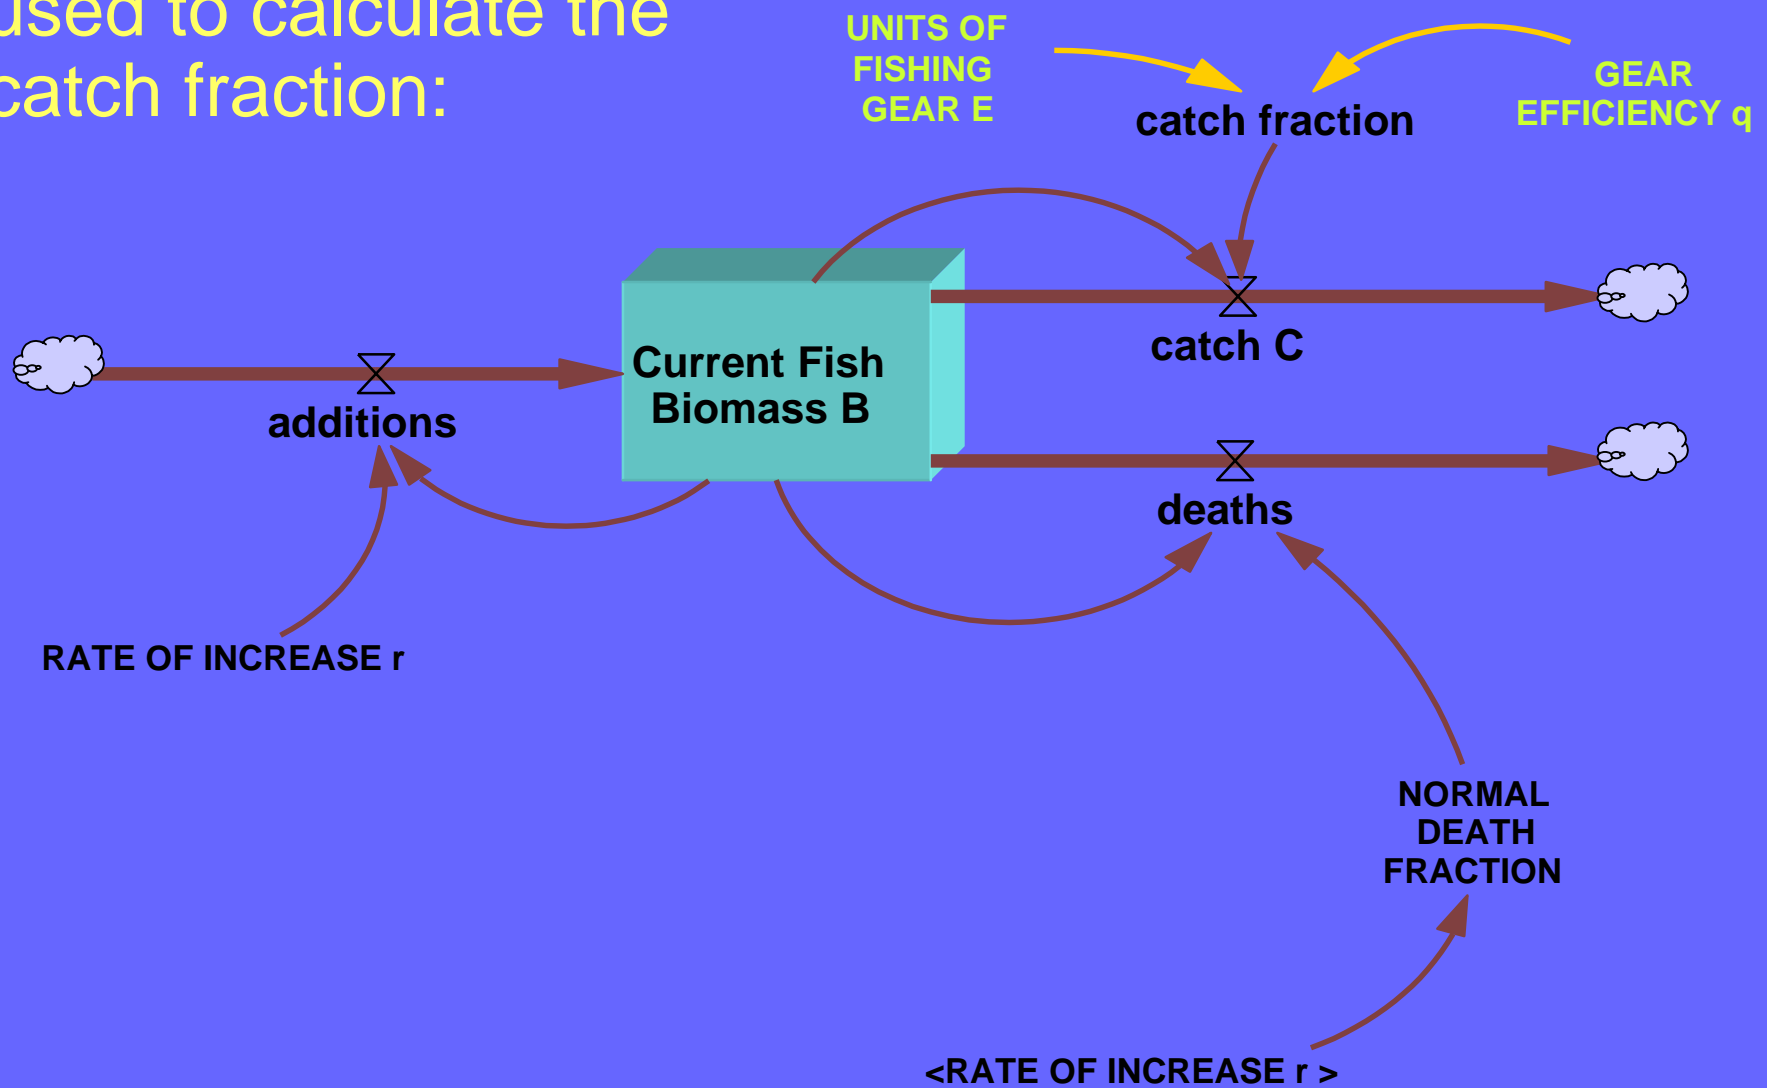

It has the following additions.....

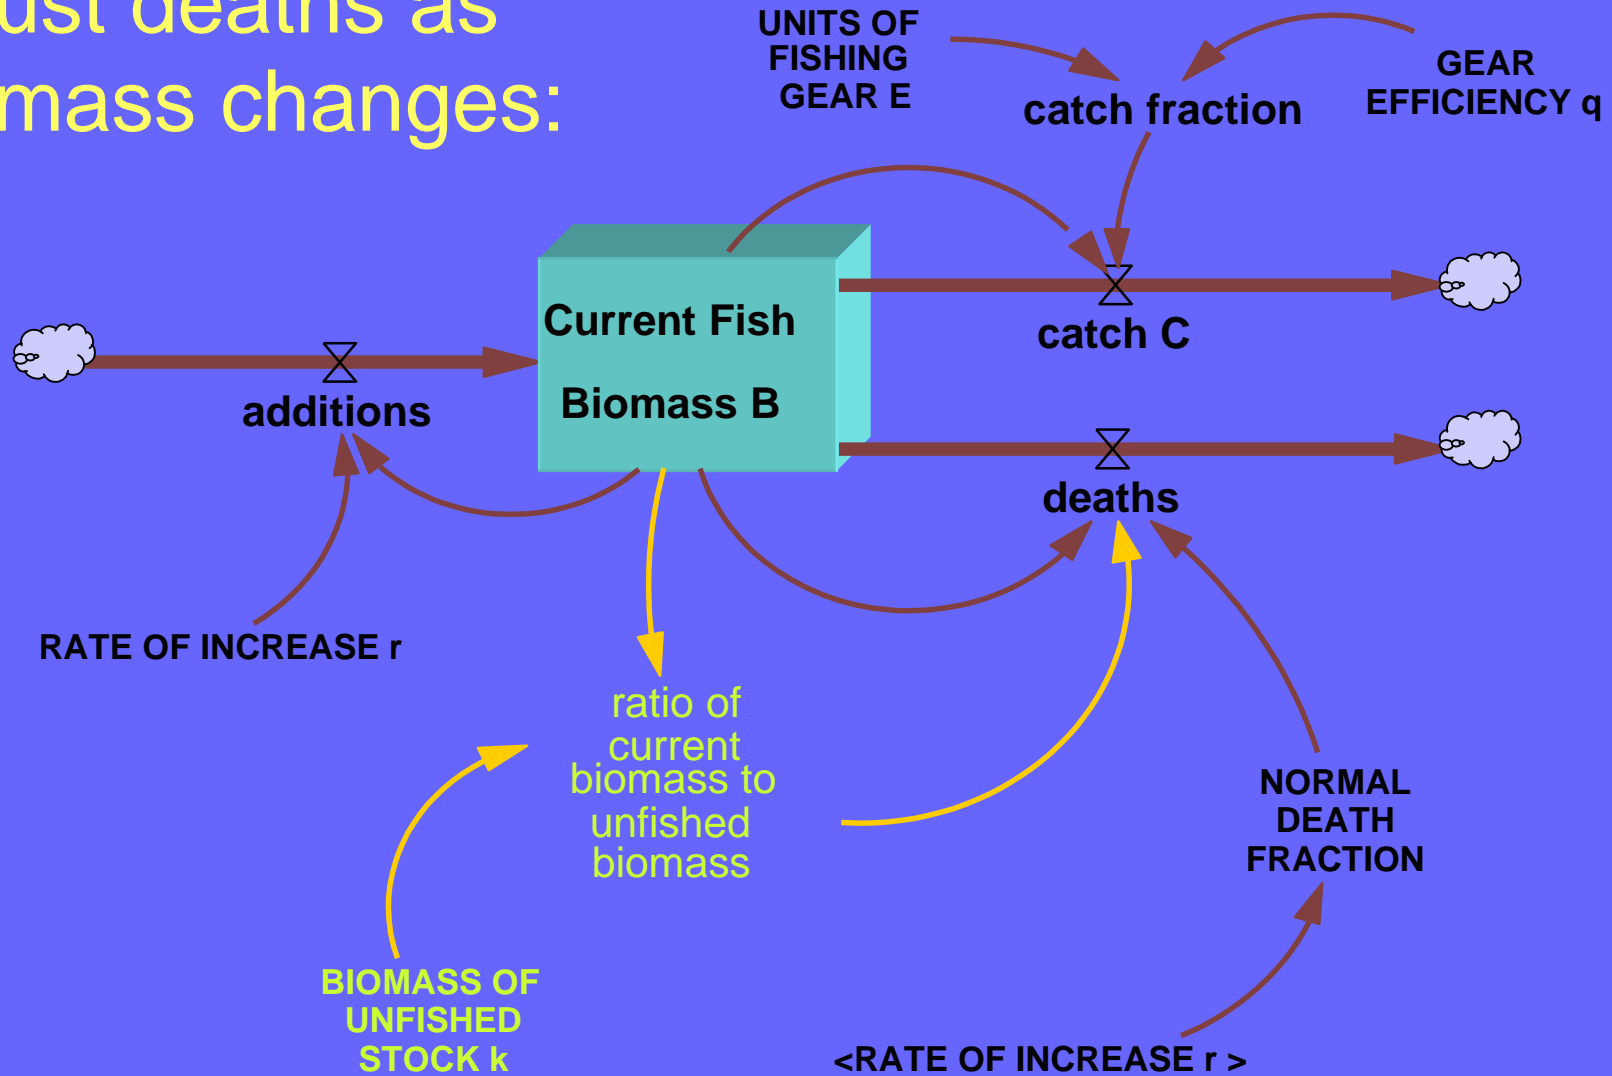

These additions help calculate the inflow and outflows:

These additions are used to calculate the catch fraction:

These additions
adjust deaths as
biomass changes:

Each Model Component Contains:

The screenshot shows a software window titled "Editing equation for - additions". The main text area contains the equation: $\text{Current Fish Biomass } B * \text{RATE OF INCREASE } r$. A yellow callout box labeled "An equation" points to this text.

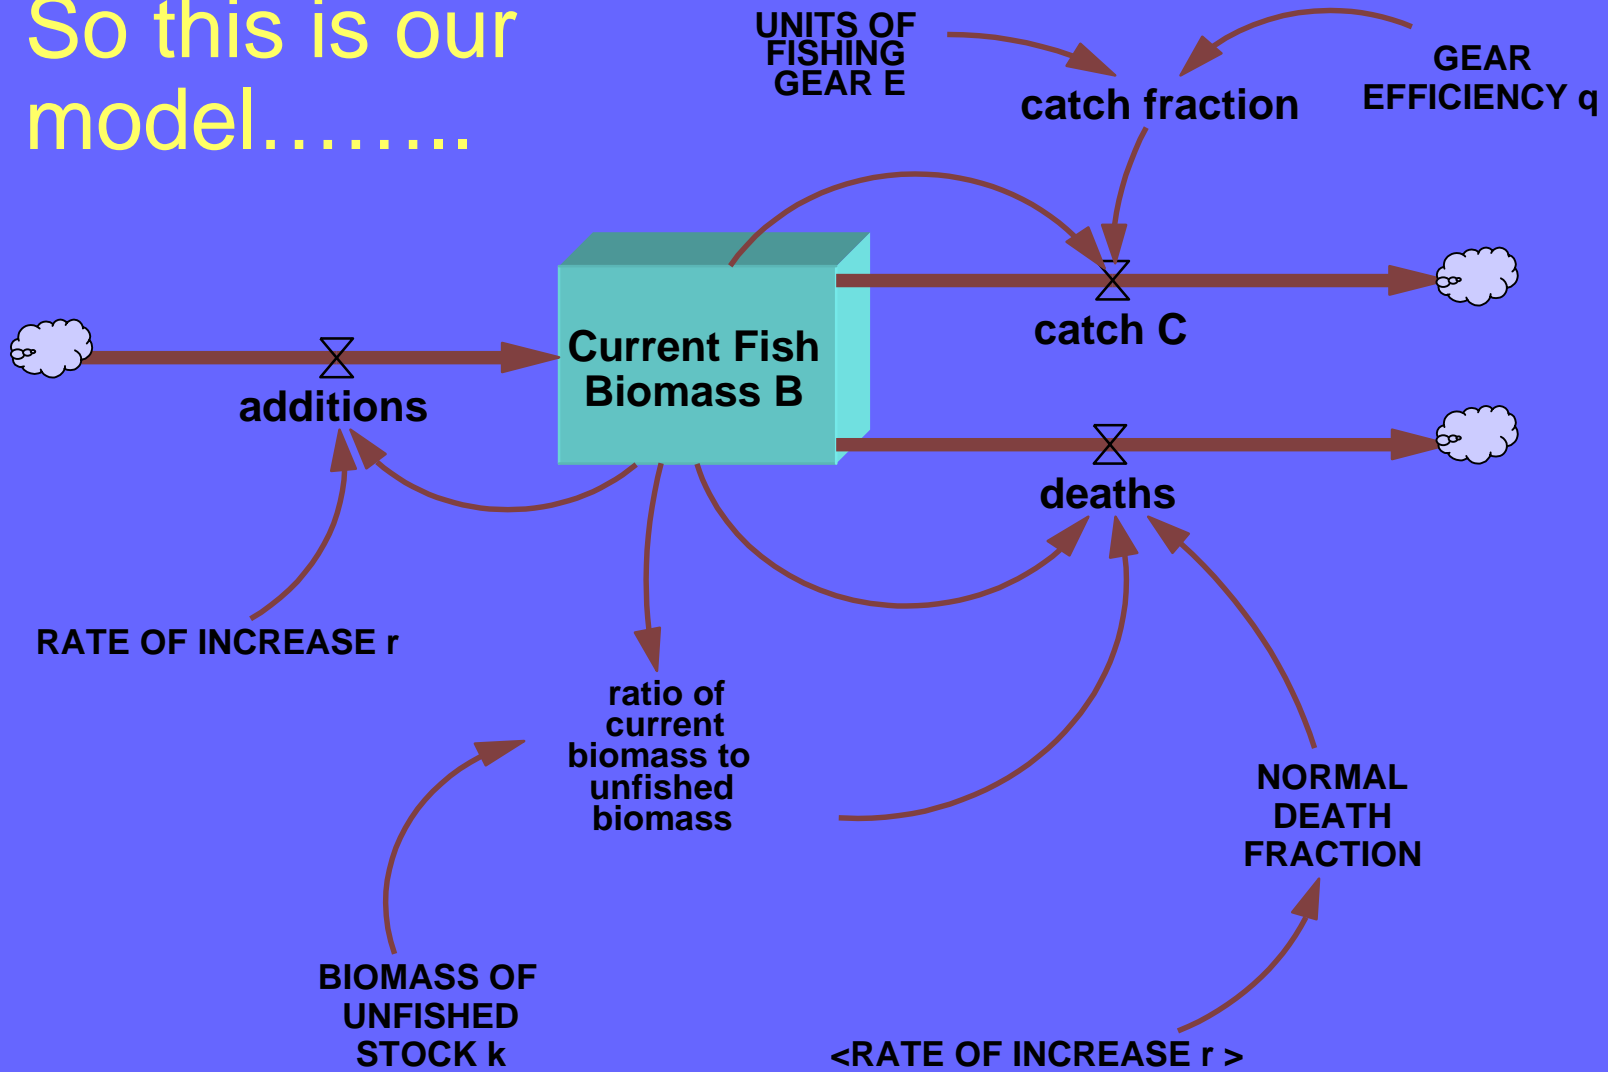

Below the equation is a control panel. On the left, there are dropdown menus for "Type" (set to "Auxiliary") and "Normal", a "Supplementary" checkbox, and a "Help" button. In the center is a numeric keypad with buttons for digits 0-9, mathematical operators (+, -, *, /, ^), and parentheses. On the right, there are tabs for "Variables", "Functions", and "More". Below these tabs is a "Choose Initial Variable" field containing the text "Current Fish Biomass B" and "RATE OF INCREASE r". A yellow callout box labeled "units" points to this field.

Below the control panel is a "Units:" dropdown menu set to "kg/Year". A yellow callout box labeled "units" points to this dropdown.

Below the units is a "Com-ment:" text area containing the text "Amount of biomass added to the population each year." A yellow callout box labeled "And a brief explanation" points to this text.

At the bottom, there is an "Errors:" field showing "Equation OK". Below the errors field are five buttons: "OK", "Check Syntax", "Check Model", "Delete Variable", and "Cancel".

So this is our model.....

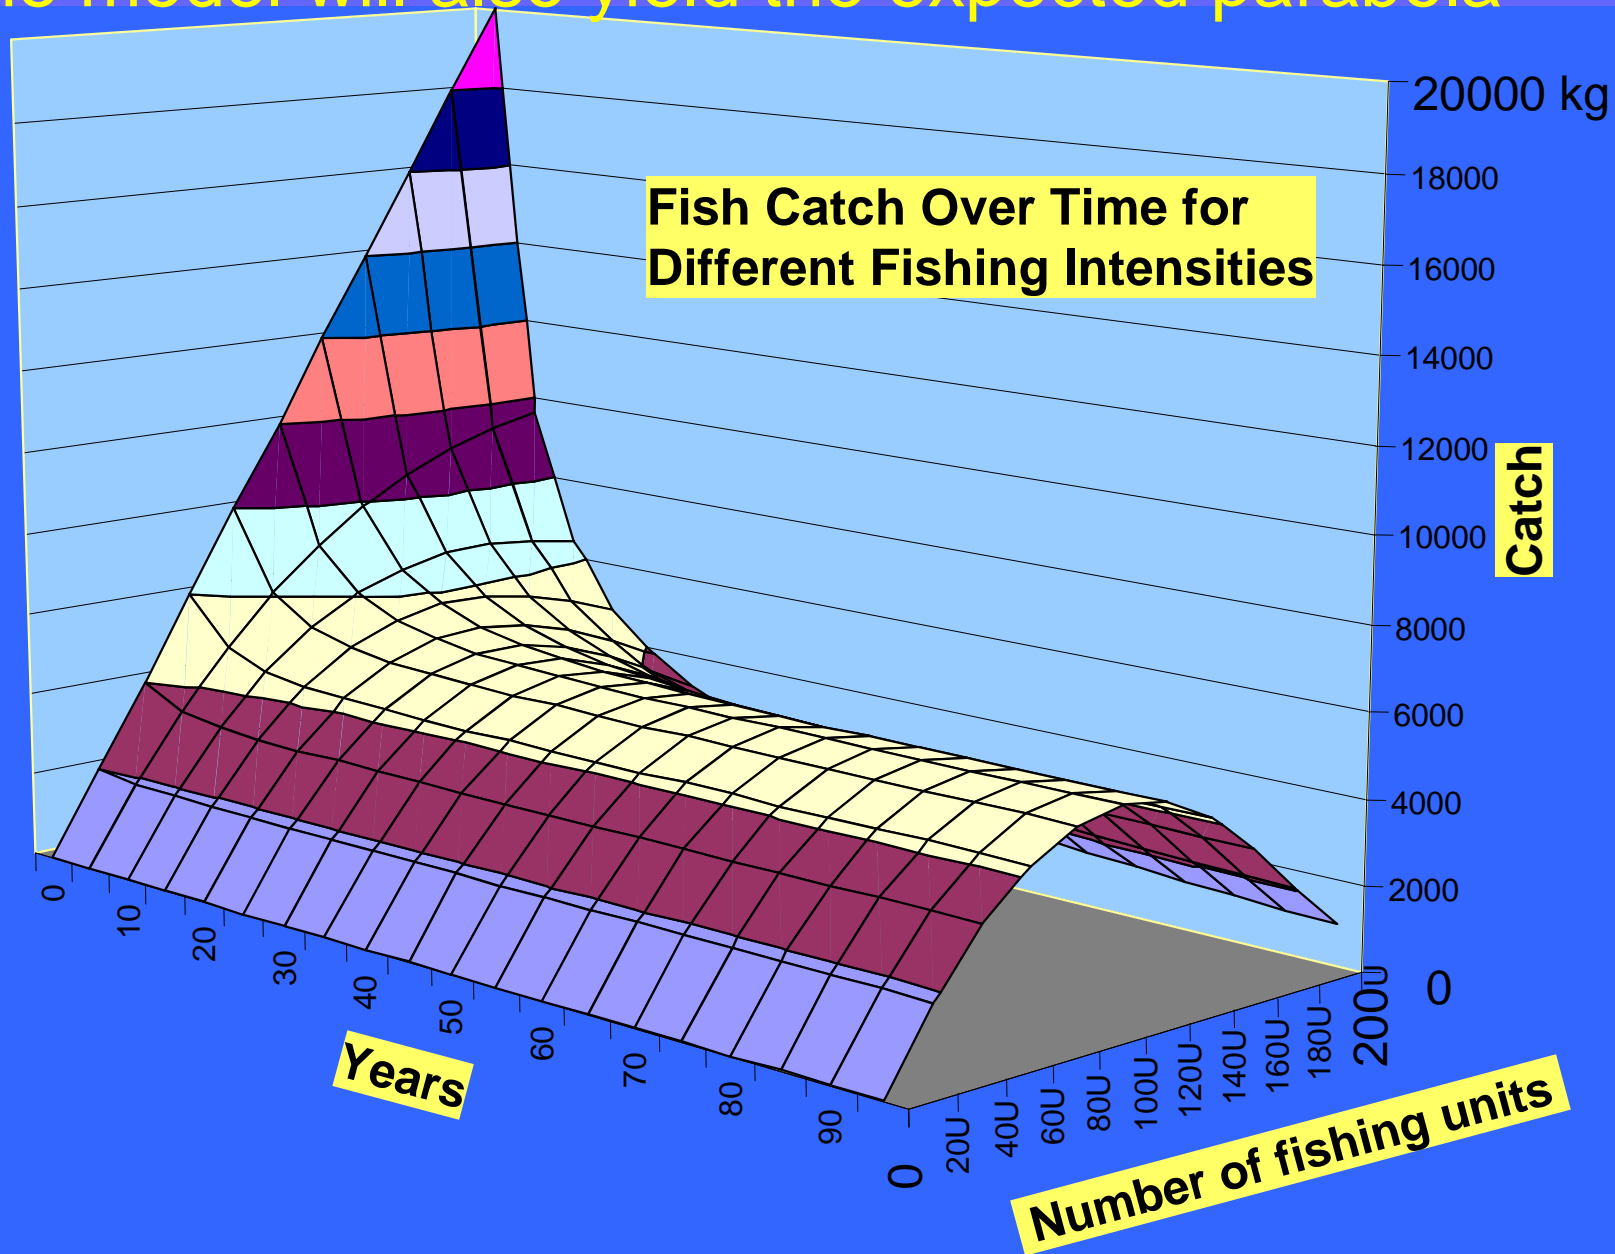

Any comments or suggestions?

Typical SD output follows variables over time:

The model will also yield the expected parabola

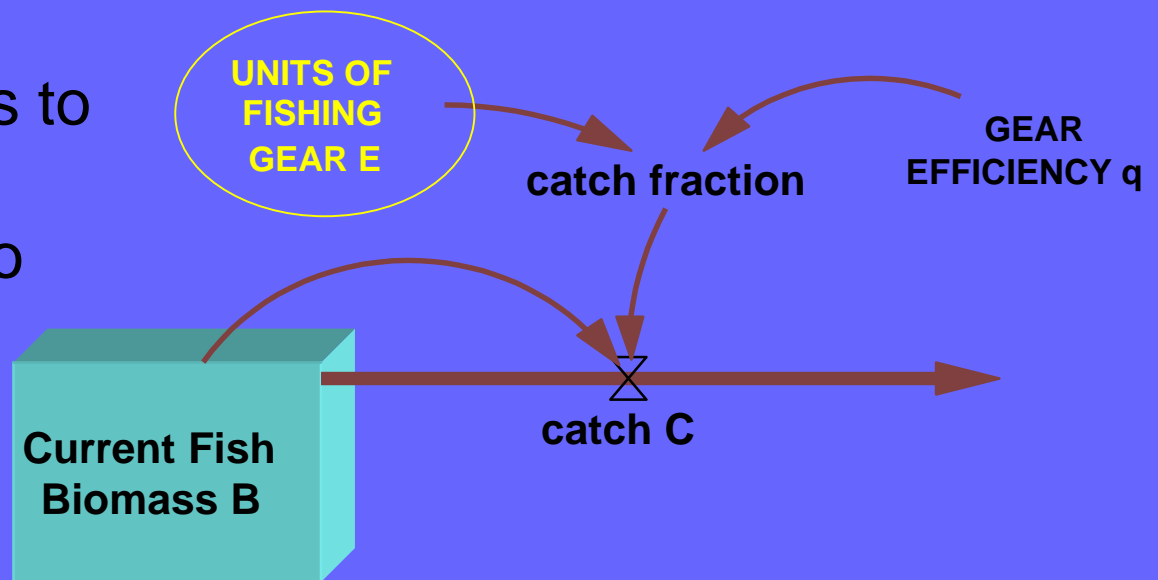

This Approach Creates Models that

- consist of **understandable** components,
- have a **clear description** of each component,
- have a relatively **simple equation** for each component,
- are thus open to **discussion**,
- can be **easily examined** and **modified**.

One Value of SD Approach is:

- The ease with which **model structure** can be **modified**

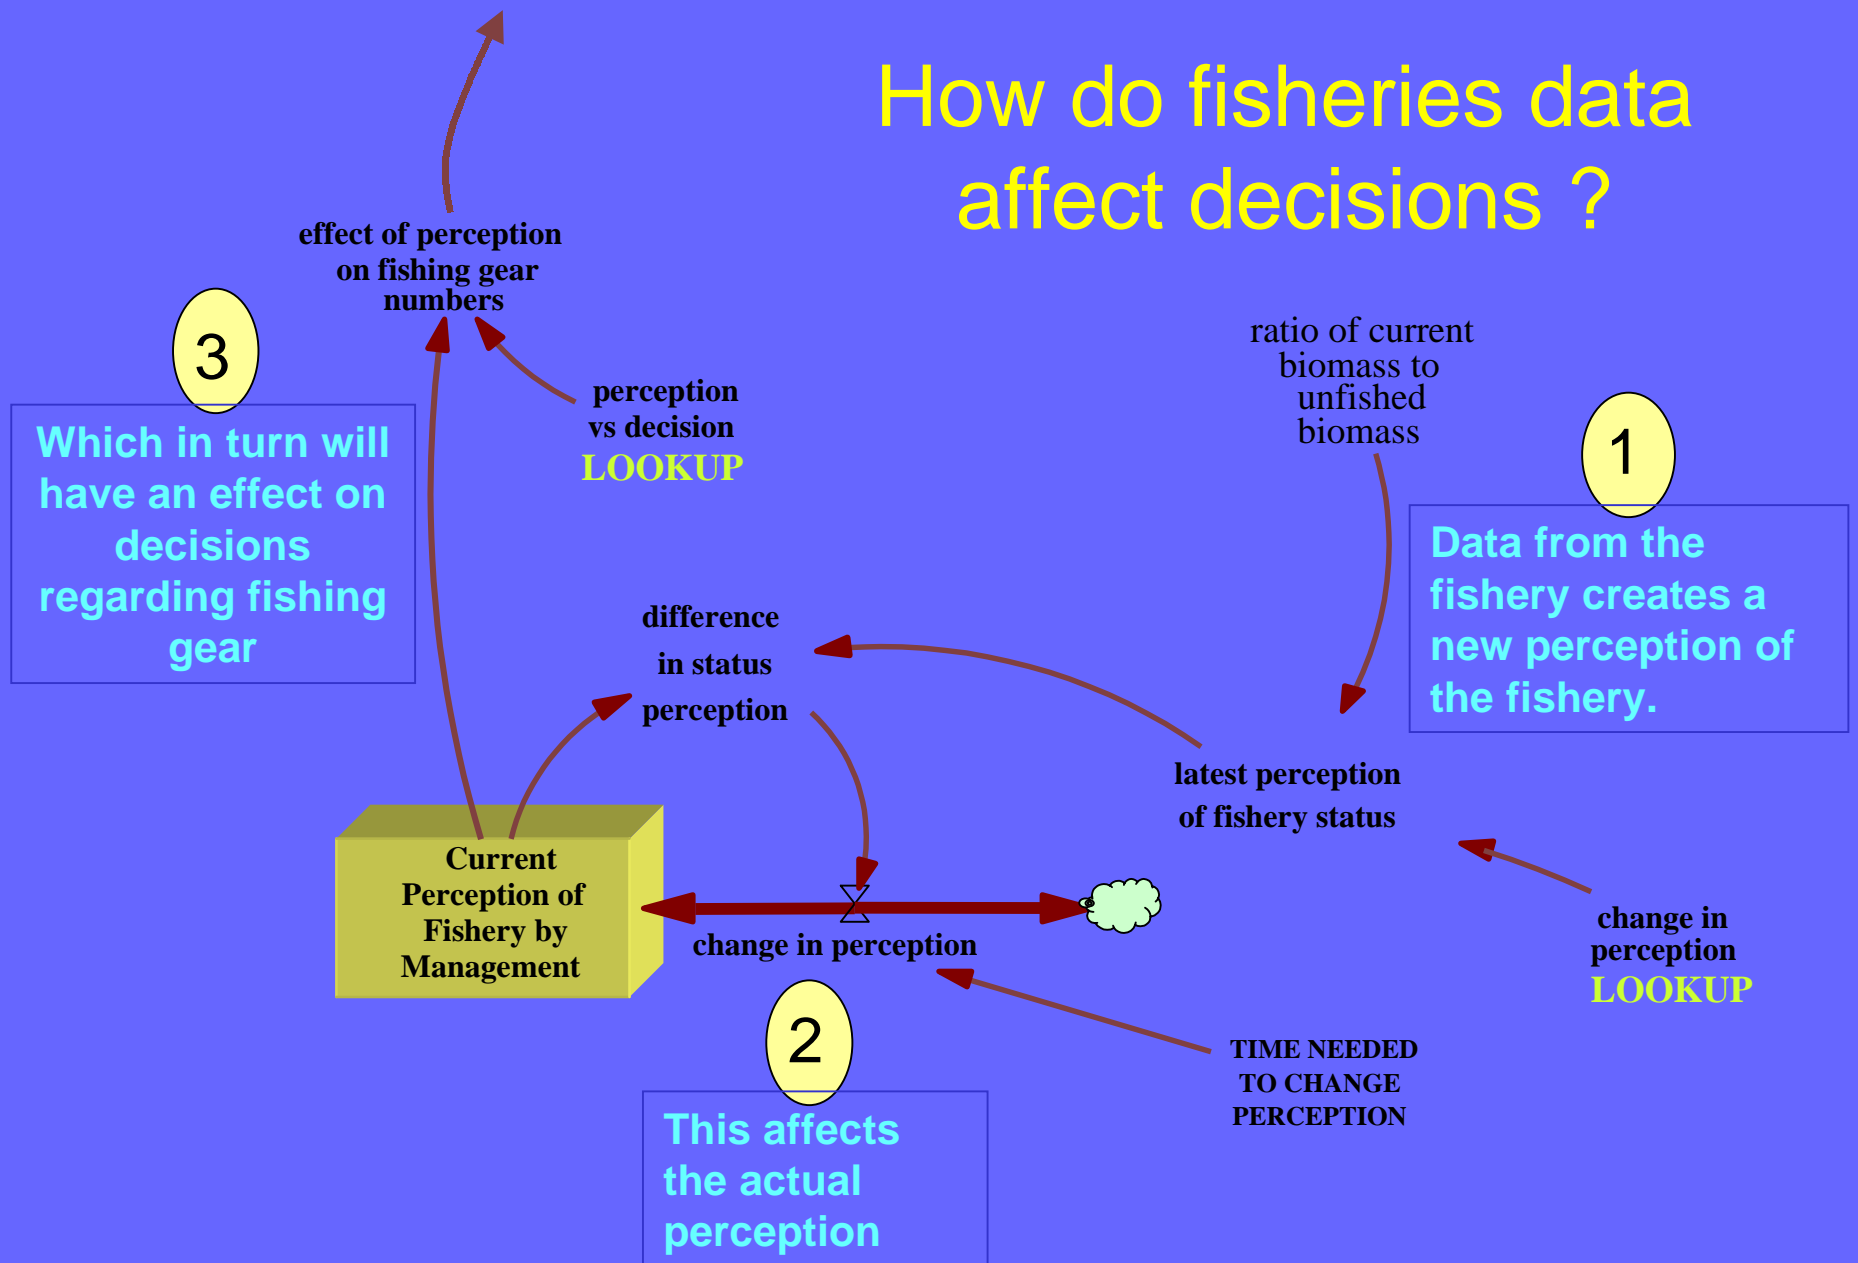

For example we can add model components to change **fishing gear numbers** in response to management needs.

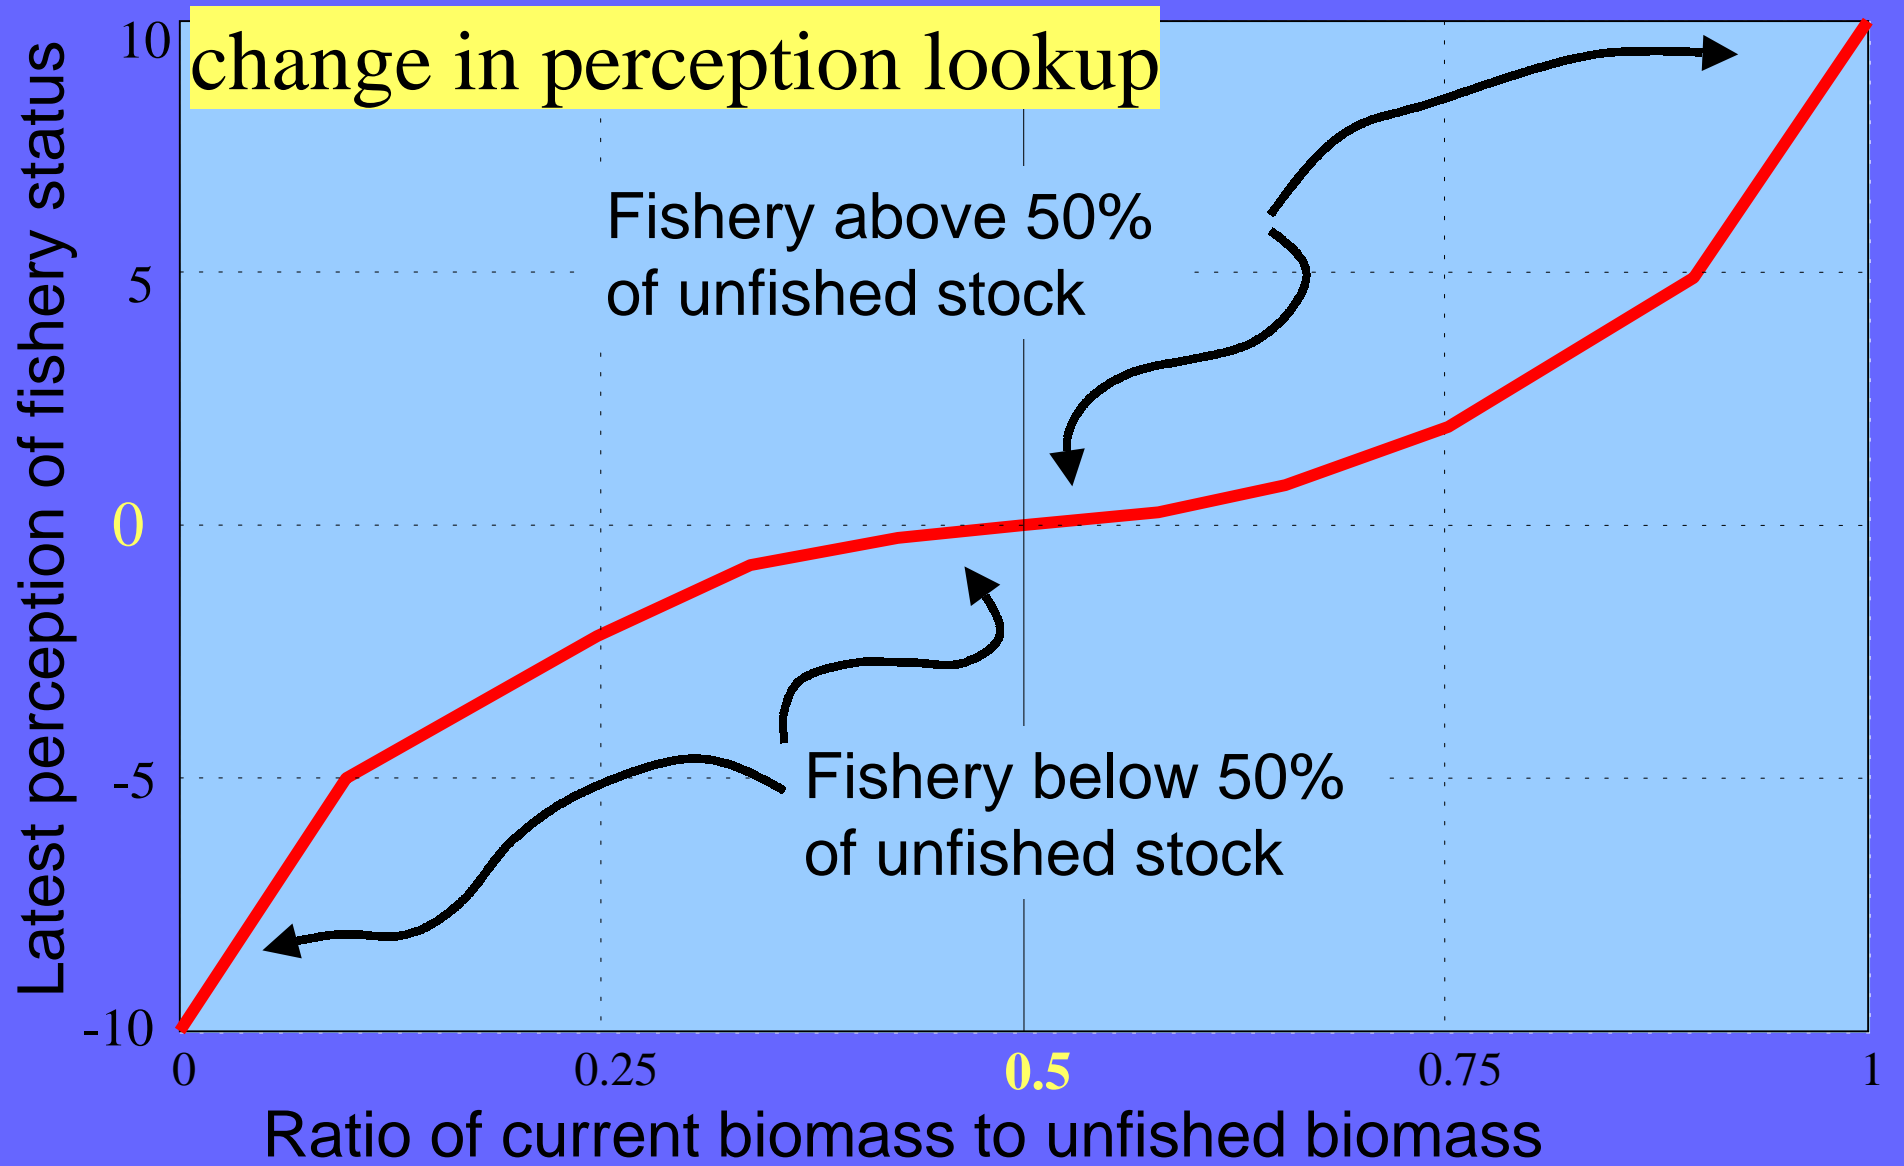

Suppose We Have a Fishery Fully Controlled by Management:

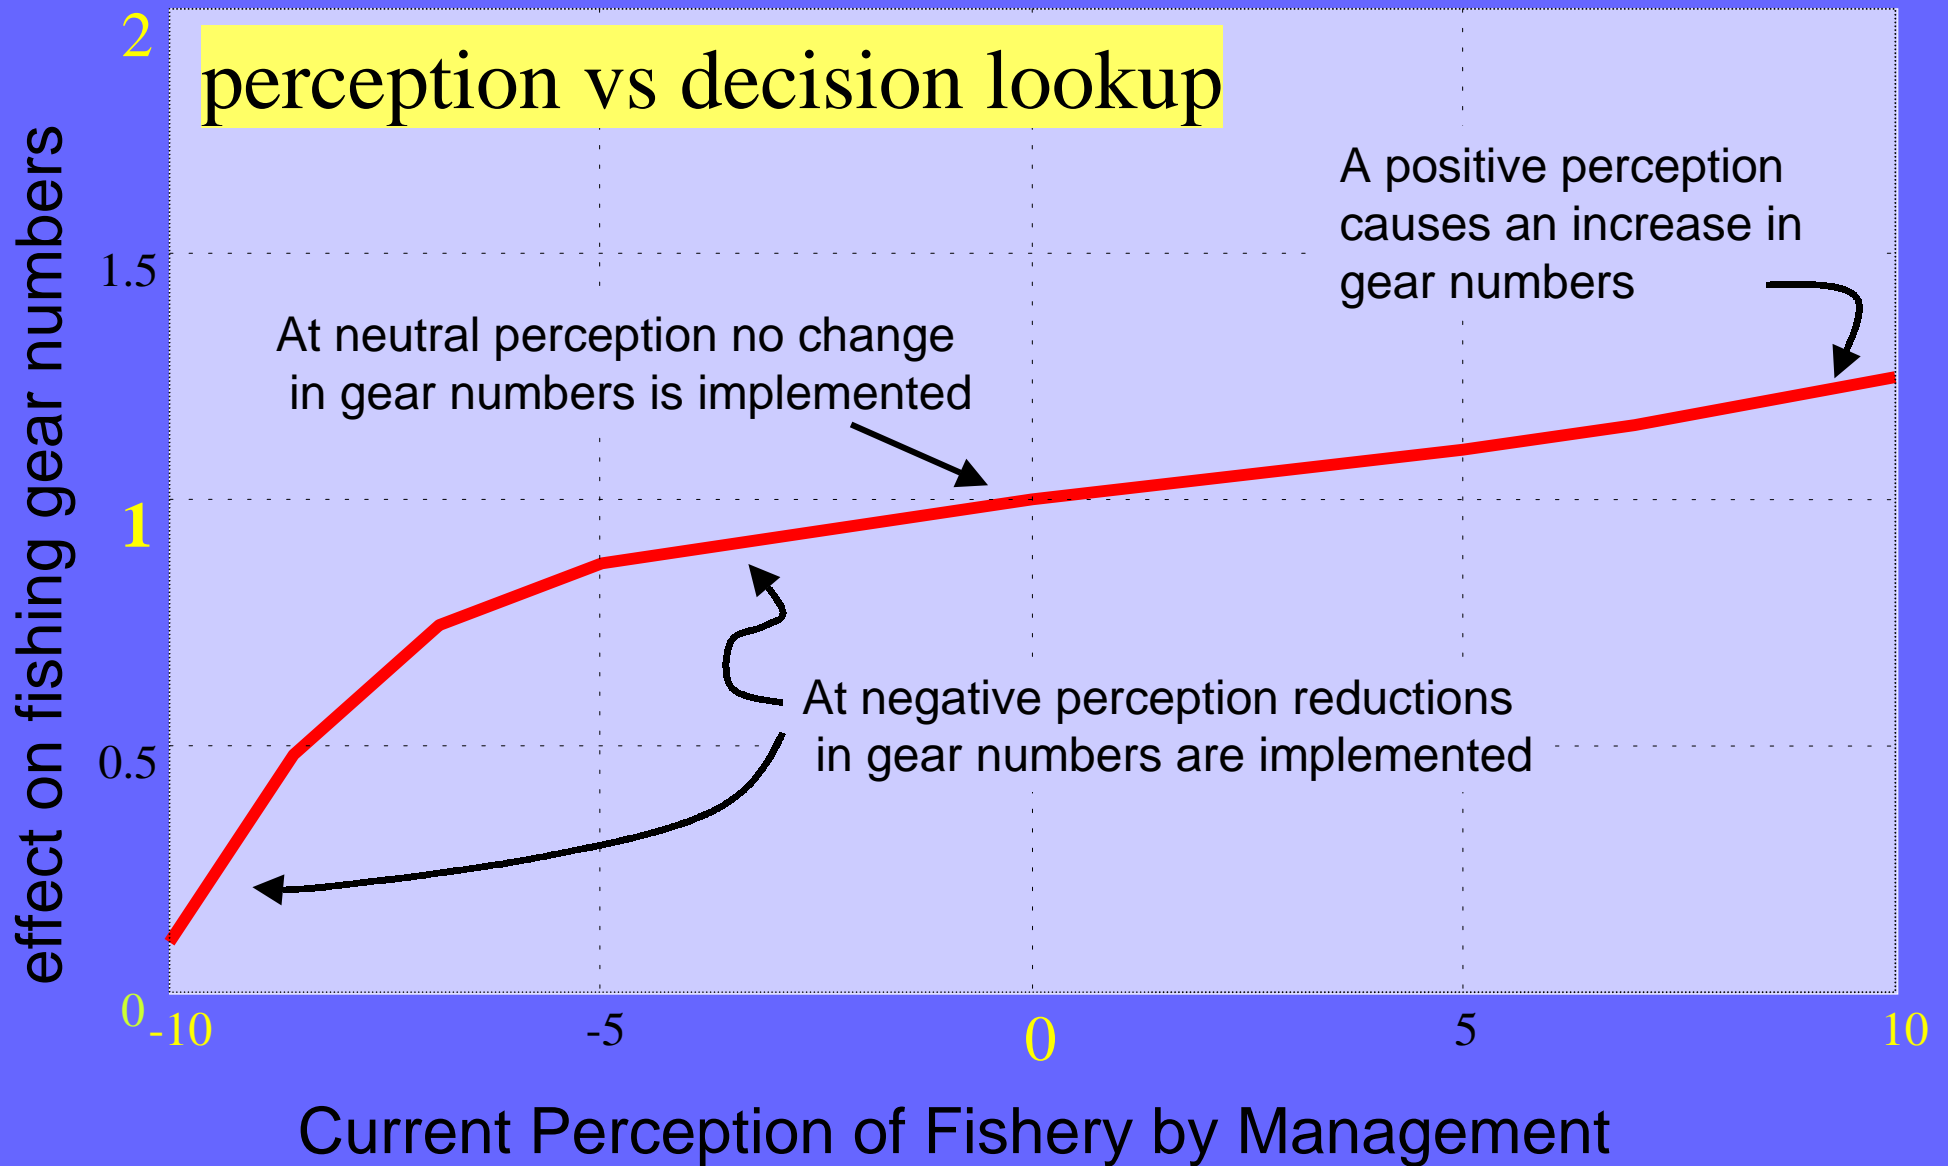

- ✓ Management personnel examine the fish population on a regular basis.
 - ✓ Consideration of new data changes their perception of the fishery.
 - ✓ They realize that a change in gear numbers is needed.
 - ✓ After an implementation delay new fishing gear numbers are put into use.
- This might be modeled as follows.....

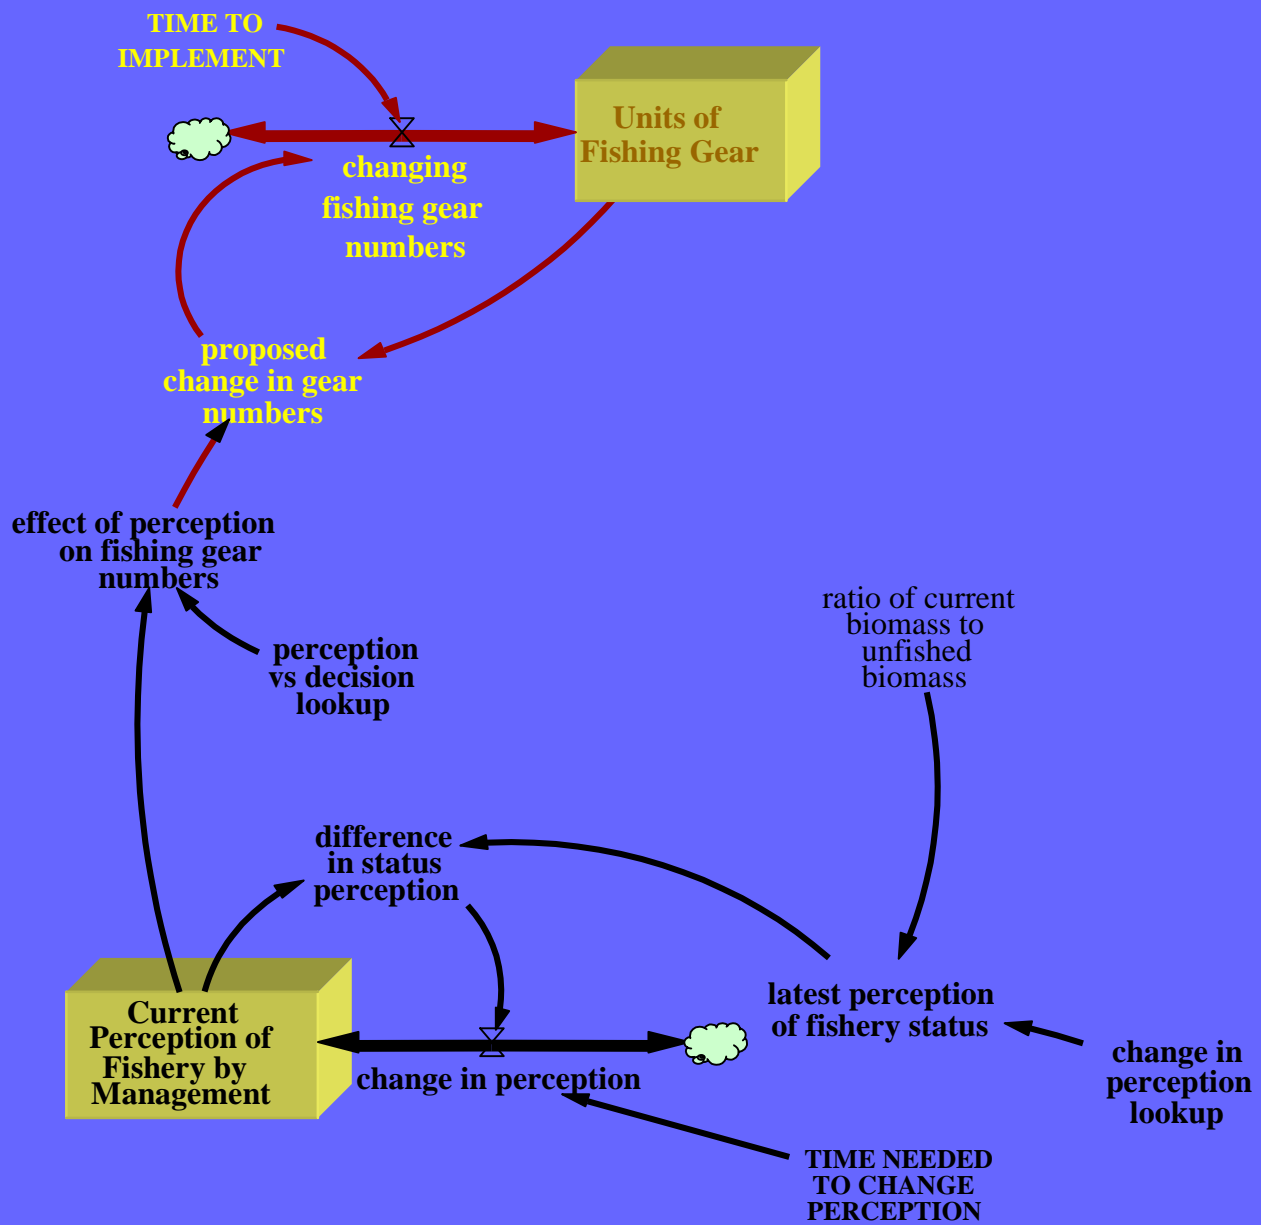

How do fisheries data affect decisions ?

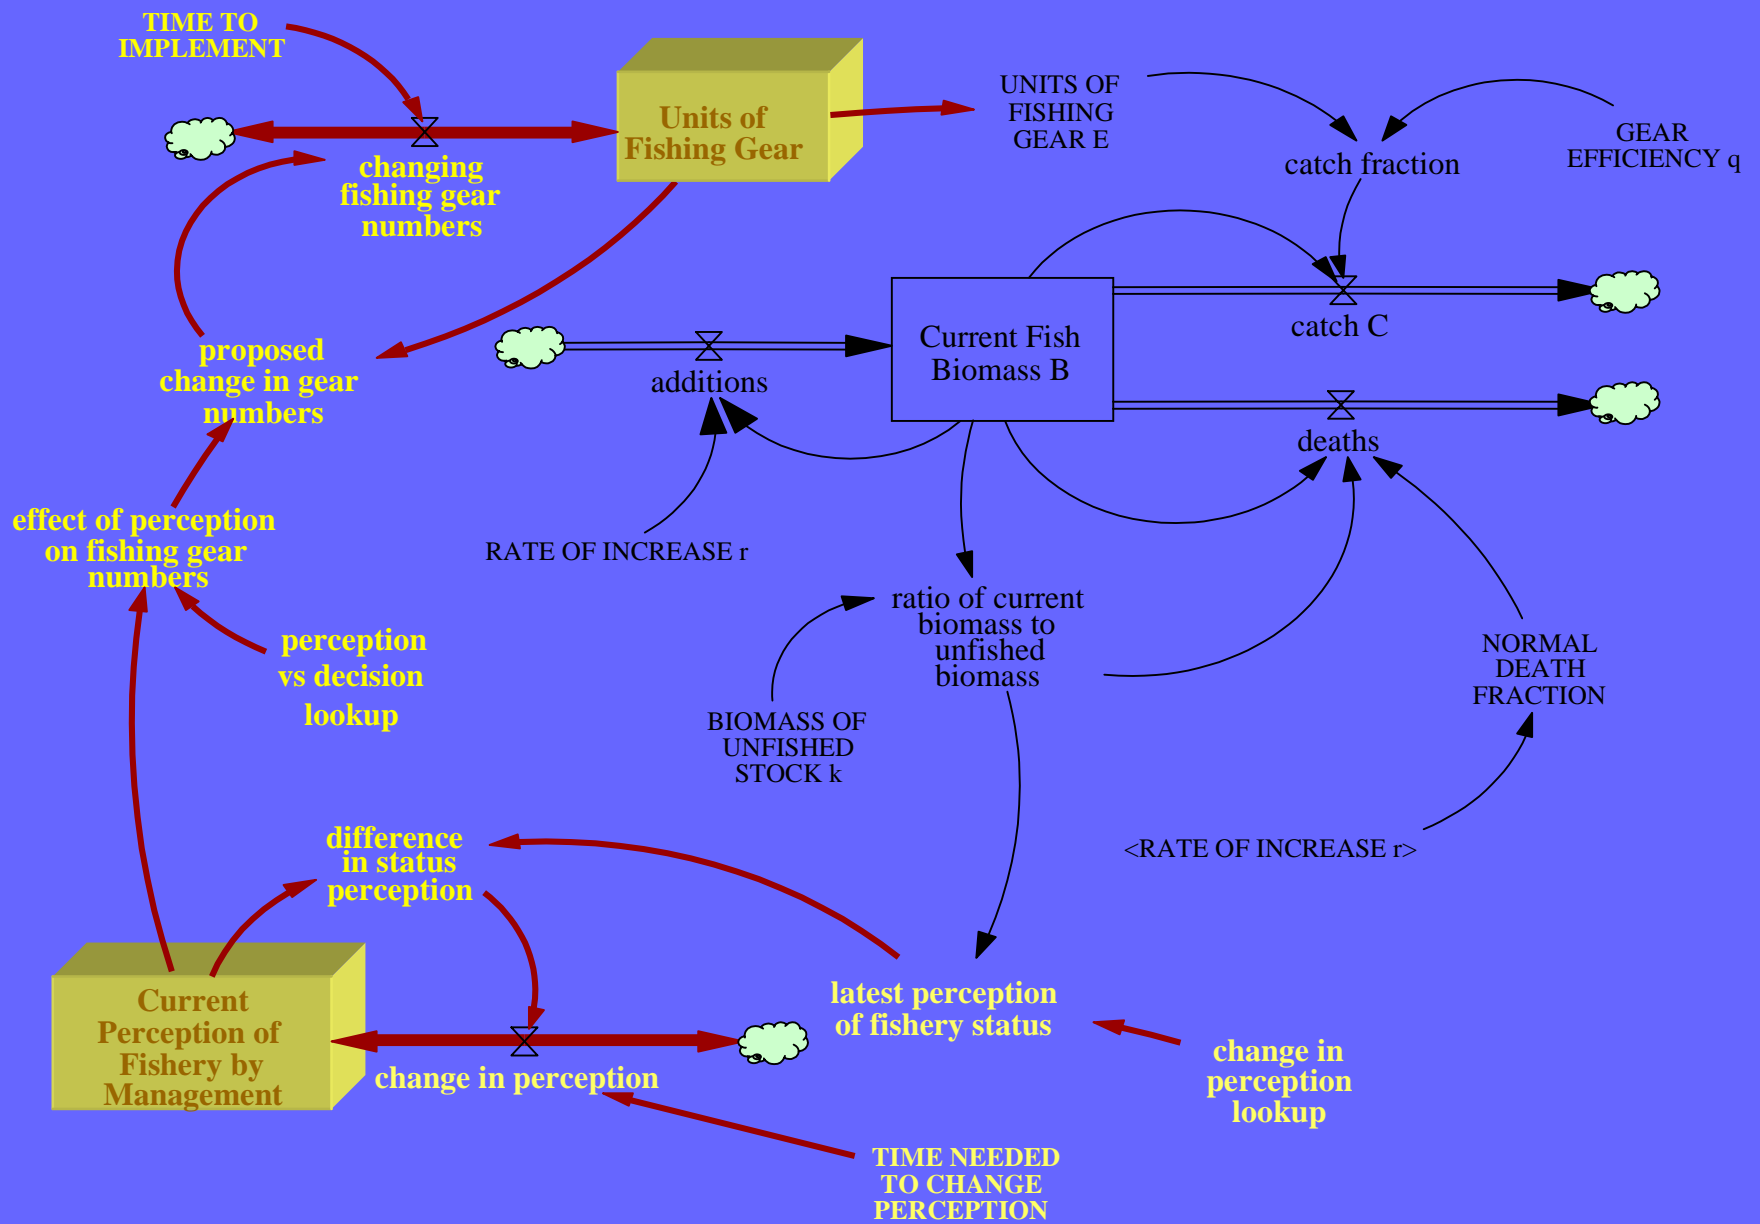

perception vs decision lookup

200 kg/(units*Year)
200 units
8,000 kg/Year
100,000 kg

Response of the Managed Fishery Start: Virgin Stock and One Unit of Gear

biomass

catch

cpue

units of gear

Time (Year)

Suppose Fishing Gear Efficiency Increases:

- By 50% between years 10 and 15
- In other words: fishers improve their ability to catch fish with each unit of gear

How will the model react?.....

Response of the Managed Fishery to a 50% Increase in Gear Efficiency During Years 10 to 15

100 kg/(units*Year)
200 units
8,000 kg/Year
100,000 kg

50
100
5,000
50,000

biomass

units of gear

catch

cpue

Time (Year)

50% Increase in Gear Efficiency During Years 10 to 15
with different implementation times

Units of Fishing Gear

System Dynamics modeling:

- creates an interconnected system of straightforward equations, which
- clearly presents model structure
- permitting open discussion and modification.
- This makes it more likely that the model will include critical information from all stakeholders.
